

RETAIL SALES PERFORMANCE ANALYSIS

A Comprehensive Report on the Executive Summary, Regional Performance, and Customer Performance Power BI Dashboards

Analysis Period: January 2023 – July 2024

1. Executive Summary

This report presents a comprehensive analysis of a three-page Power BI reporting suite covering overall business performance, regional performance, and customer performance for a multi-region retail operation spanning five geopolitical regions and twenty store branches in Nigeria. Between January 2023 and July 2024, the business recorded 484 transactions, moved 2,580 units, and generated ₦78.7 million in total revenue, served by 182 unique customers and 8 sales representatives.

The dashboard suite is built around three linked views: an Overview page summarizing headline KPIs, monthly revenue trends, category mix, payment preferences, and returns; a Regional page breaking performance down by city, region, and branch; and a Customer page profiling the customer base by type, loyalty status, age, and gender. Electronics dominates the category mix at 78.7% of revenue, POS is the leading payment method, and the South South region — anchored by Benin City — is the strongest-performing region.

A notable area of concern across all three views is the return rate. At 22.73%, nearly one in four transactions is being returned, which is high for a retail operation of this kind and merits focused investigation, discussed further in Section 5.

2. Executive Summary Dashboard

The Overview page is the entry point of the report, giving leadership a snapshot of top-line performance across all regions, with slicers for year, month, and sales representative, and quick-filter buttons for each of the five regions (North Central, North West, South East, South South, South West).

2.1 Headline KPIs

\$78.7M Revenue	484 Total Transactions	2,580 Total Quantity	22.73% Return Rate	77.27% No-Return Rate
---------------------------	----------------------------------	--------------------------------	------------------------------	---------------------------------

Note: the KPI card displays the revenue figure with a dollar sign, while the regional and store-level breakdowns use Naira-denominated figures (e.g., store totals summing to ₦102,194,700). This inconsistency should be reconciled — see Section 6 (Recommendations) — as it currently makes it unclear whether \$78.7M and the ₦102.19M+ store totals represent the same underlying figures in different currencies, or a data/labeling error.

2.2 Revenue by Month and Year

Monthly revenue is highly volatile rather than showing a steady growth or seasonal trend. Values swing between roughly ₦2M and a peak of nearly ₦10M around early-to-mid 2024, with sharp troughs following almost every peak. This saw-tooth pattern, sustained over 19 months (Jan 2023–Jul 2024), suggests revenue is being driven by a small number of large, irregular transactions or bulk orders rather than a steady stream of consistent sales — a pattern worth validating against the underlying transaction log.

2.3 Sales by Category

Electronics is overwhelmingly the dominant category, accounting for 78.7% of revenue. The remaining categories are, in descending order:

- Home & Kitchen — 10.9% of revenue
- Clothing — 6.6% of revenue
- Health & Beauty — 2.5% of revenue
- Groceries — the remainder, the smallest slice on the donut

This level of concentration in a single category represents both a strength (a clear core competency) and a risk (limited diversification). A downturn in electronics demand, supply issues, or increased competition in that category would disproportionately affect total revenue.

2.4 Revenue by Payment Type

POS is the clear leader in revenue contribution, followed by Transfer, Cash, Card, and Online, in that order. The heavy skew toward POS and Transfer (versus Card and Online) suggests a customer base and/or store network that still favors in-person, terminal-based, or bank-transfer payments over digital card and online checkout options — relevant context for any future e-commerce or digital payment strategy.

2.5 Revenue by Return Flag

The bar chart splits revenue into non-returned ("No") and returned ("Yes") transactions. Non-returned revenue is roughly four times larger than returned revenue, which is consistent with the 77.27% no-return / 22.73% return-rate split shown in the KPI cards. Even so, a return rate above one-fifth of transactions is elevated for most retail categories and is the single most important flag raised by this dashboard suite.

3. Regional Performance Dashboard

The Regional page drills into how the 484 transactions and ₦102.19M+ in tracked sales are distributed across the business's 5 regions and 20 branches, with the same slicer panel (Year, Month, SalesRepID) carried over from the Overview page for consistent filtering.

3.1 Headline KPIs

5 Total Regions	484 Total Transactions	408 Avg. Quantity	15.74M Avg. Revenue
---------------------------	----------------------------------	-----------------------------	-------------------------------

3.2 Revenue by City

At the city level, Benin City is the standout performer, generating roughly ₦20M in revenue — more than double the next closest city. It is followed, in descending order, by Jos, Port Harcourt, Enugu, Aba, Kano, Lagos, Warri, and Sokoto. Notably, Lagos — often assumed to be Nigeria's leading commercial hub — ranks only seventh of nine cities shown, behind smaller cities such as Enugu and Aba, which is worth flagging to stakeholders as a possibly counter-intuitive finding.

3.3 Revenue by Region

South South is the leading region by a wide margin, at roughly ₦40M in revenue with a visible split between returned and non-returned sales. South East and South West follow as the next-strongest regions, with North Central and North West trailing as the weakest-performing regions on the chart.

3.4 Sales by Category (Regional Split)

The category chart mirrors the regional revenue ranking, with South South again leading at roughly ₦40M, and each region's bar showing the same No/Yes return-flag split seen elsewhere in the report, reinforcing that returns are a cross-regional issue rather than one confined to a single area.

3.5 Branch-Level Performance

The store-level table (sorted by total sales, descending) provides the most granular view in the suite. The strongest individual branches are:

Store Name	Region	Transactions	Quantity	Total Sales (₦)
Benin City Branch 1	South South	14	80	13,106,100
Enugu Branch 1	South East	10	49	7,712,700
Port Harcourt Branch 2	South South	12	57	6,828,000
Aba Branch 3	South East	15	89	6,386,100
Jos Branch 3	North Central	14	75	4,808,900
Lagos Branch 1	South West	9	53	4,284,000
Port Harcourt Branch 3	South South	16	56	4,238,900
Warri Branch 3	South South	20	88	4,213,150
Warri Branch 1	South South	13	80	3,921,330
Kano Branch 3	North West	13	53	3,693,700
Benin City Branch 2	South South	16	108	3,654,000

Store Name	Region	Transactions	Quantity	Total Sales (₦)
Jos Branch 1	North Central	11	73	3,339,300
Kano Branch 1	North West	18	90	2,629,400
Jos Branch 2	North Central	9	77	2,543,100
Lagos Branch 2	South West	8	36	2,366,200
Abeokuta Branch 3	South West	10	40	2,349,400
Lagos Branch 3	South West	8	46	2,133,200
Sokoto Branch 3	North West	8	35	2,098,000
Total (Top 18 of 20 branches shown)		484	2,580	102,194,700

Three points stand out from the branch table:

- Benin City Branch 1 is the single top-performing store, generating ₦13.1M — roughly 70% more than the second-place branch (Enugu Branch 1).
- Warri Branch 3 records the highest transaction count (20) and among the highest quantities (88) of any branch, yet ranks only 8th in total sales — indicating a lower average transaction/basket value than the top revenue-generating branches.
- Several South West branches (Lagos and Abeokuta) sit toward the bottom of the ranking despite Lagos's reputation as a major commercial center, echoing the city-level finding in Section 3.2.

4. Customer Performance Dashboard

The Customer page shifts the lens from geography to the people driving revenue — profiling the 182 unique customers behind the 484 transactions by loyalty status, customer type, age, and gender.

4.1 Headline KPIs

182 Total Customers	484 Total Transactions	11 Qty / Customer	\$432.51K AOV
-------------------------------	----------------------------------	-----------------------------	-------------------------

As with the Overview page, the AOV figure is presented with a dollar sign; this should be reconciled against the currency used elsewhere in the report suite (see Section 6).

4.2 Revenue by Customer

A small handful of individual customers account for a disproportionate share of revenue. The top five customers by revenue are CUST1189, CUST1009, CUST1101, CUST1196, and CUST1197, with CUST1189 alone visibly ahead of the rest. This concentration at the top of the customer list is consistent with the volatile month-to-month revenue pattern noted in Section 2.2, and suggests a small set of high-value accounts that merit dedicated relationship management.

4.3 Customer Type: Revenue and Transactions

Across both the revenue and transaction-count charts, customer types rank consistently in the same order:

- Walk-In — highest revenue and highest transaction volume
- Loyal — second-highest on both measures
- Corporate — third
- Online — lowest on both measures

The fact that Walk-In customers outperform the Loyal segment on both revenue and transaction count is worth examining: it may indicate that the loyalty program has room to grow, or that walk-in traffic is simply larger in absolute volume than the enrolled loyalty base.

4.4 Returning vs New Customers

Of the customer base, 132 customers (72.53%) are returning customers, while 50 customers (27.47%) are new. A near three-to-one ratio of returning to new customers is generally a healthy sign of customer retention, though it should be read alongside the elevated 22.73% return-rate metric from the Overview page — the two "return" concepts (customer returning to buy again vs. product returned) are distinct and should not be conflated when reporting to stakeholders.

4.5 Revenue by Age Group

Adult customers generate the most revenue, followed by Youth, then Elder, with a small "N/A" segment where age data is missing or unrecorded. The gap between Adult and Youth is moderate, while Elder customers contribute markedly less — useful input for age-targeted marketing or product assortment decisions.

4.6 Revenue by Gender

Male customers generate the largest share of revenue, followed by Female, with a smaller "N/A" (unspecified/missing) segment. The gap between Male and Female is relatively modest compared to some of the other splits in this report, indicating a fairly balanced customer base by gender.

5. Cross-Dashboard Insights

Viewing all three dashboards together surfaces patterns that are not obvious from any single page:

- Revenue concentration is a recurring theme: 78.7% of revenue from one category (Electronics), a handful of top customers driving outsized revenue, and Benin City alone outperforming most other cities combined. This suggests the business's growth and risk profile is closely tied to a narrow set of categories, customers, and locations.
- Geographic performance does not track conventional assumptions about Nigeria's commercial centers — Lagos ranks mid-to-low across both the city and branch views, while Benin City and the broader South South region lead. This is a genuine, actionable insight rather than a data quality concern, but is worth double-checking against store count and market size to ensure it isn't simply a function of fewer, larger transactions in Benin City.

- The 22.73% return rate is consistent across the Overview and Regional pages and is high enough to warrant root-cause investigation (e.g., by category, by branch, or by payment type) rather than being treated as background noise.
- Currency labeling is inconsistent between the Overview/Customer pages (which use "\$") and the Regional page's store table (which uses Naira-scaled figures). This should be resolved before the report suite is shared externally or used for financial decision-making.
- Payment preference (POS/Transfer-led) and channel performance (Walk-In-led, Online lowest) both point toward a customer base that is still predominantly in-person/offline, which has implications for any planned digital or e-commerce expansion.

6. Recommendations

- Investigate the 22.73% return rate as a priority: break it down by category, branch, and payment type to identify whether returns are concentrated in Electronics (the dominant category) or elsewhere, and whether certain branches or SalesRepIDs show disproportionately high return rates.
- Reconcile the currency units used across the three dashboards (\$ vs ₦) so that Revenue, AOV, and store-level Total Sales figures are unambiguous and comparable.
- Investigate the volatile, saw-tooth monthly revenue pattern to determine whether it reflects genuine bulk/seasonal ordering behavior or a data entry/aggregation issue, and consider adding a rolling 3-month average trendline to smooth the visual for executive audiences.
- Explore diversification beyond Electronics, given that a single category drives nearly four-fifths of revenue; even modest growth in Home & Kitchen or Clothing would meaningfully reduce category concentration risk.
- Review why Loyal customers underperform Walk-In customers on both revenue and transaction count — this may indicate an opportunity to grow loyalty enrollment or improve loyalty-program incentives.
- Examine why Warri Branch 3 has high transaction and quantity volume but comparatively low total revenue, which may point to lower unit prices, heavier discounting, or a different product mix at that branch relative to top performers like Benin City Branch 1.
- Consider adding a fourth dashboard page (or a set of drill-through cards) focused specifically on Sales Representative performance, since SR001–SR008 appear as a slicer on every page but are not yet analyzed as a dedicated performance dimension.

7. Conclusion

This three-dashboard suite provides a solid, well-organized foundation for monitoring overall, regional, and customer performance, with clear KPI cards, consistent slicers, and complementary visuals across pages. The business shows healthy customer retention (72.53% returning customers) and a strong, identifiable core category (Electronics) and regional stronghold (South South / Benin City). The most pressing next steps are to resolve the currency labeling inconsistency, investigate the elevated product return rate, and validate the drivers behind the volatile monthly revenue trend — addressing these would materially strengthen the reliability and decision-usefulness of the reporting suite.
